Emb-Opt: Embedded MPC From Industrial PC-based MPC

Key aspects of the Emb-Opt project:

- explore industrially proven MPC packages as design tools for embedded use
 - ✓ Constraints and feasibility: hard and soft constraints, priority hierarchy
 - Tuning possibilities: scaling that captures acceptable variation/span of variables
 - Problem reduction:

move blocking, evaluation points

Emb-Opt: Embedded MPC From Industrial PC-based MPC

Key aspects of the Emb-Opt project:

- explore industrially proven MPC packages as design tools for embedded use
 - ✓ Constraints and feasibility:
 - hard and soft constraints, priority hierarchy
 - Tuning possibilities:
 - scaling that captures acceptable variation/span of variables
 - Problem reduction: move blocking, evaluation points
- Automatic code generation
- Incorporation of custom high-speed solvers
- Real-time guarantee considerations
- Efficient use of limited computational resources

Emb-Opt: Embedded MPC Open Source Architecture

- Performance of The Embedded MPC on AC500 PM592-ETH PLC
- 5 Conclusion

Prototype of Statoil's Subsea Compact Separation Process

Prototype of Statoil's Subsea Compact Separation Process

Control Objectives*:

- Control gas volume fraction (GVF) in liquid and gas outlets.
- \bullet Control pressure p_1 and $p_2,$ and the pressure difference.
- Keep process within operational limits on pressure, and GVF in outlets.
- Respect physical open limits on valves.

Prototype of Statoil's Subsea Compact Separation Process

Control Objectives*:

- Control gas volume fraction (GVF) in liquid and gas outlets.
- \bullet Control pressure p_1 and $p_2,$ and the pressure difference.
- Keep process within operational limits on pressure, and GVF in outlets.
- Respect physical open limits on valves.
- * Performance for worst case inlet flow scenario required!

The Target Platform: AC500 PM592-ETH PLC

- Freescale MPC603e RISC CPU: 500MIPS, 250MFLOPS @ 200 MHz
- FPU: fully IEEE 754-compliant for both single- and double-precision
- 4 MB RAM program memory, 4 MB integrated data memory

The Target Platform: AC500 PM592-ETH PLC

- Freescale MPC603e RISC CPU: 500MIPS, 250MFLOPS @ 200 MHz
- FPU: fully IEEE 754-compliant for both single- and double-precision
- 4 MB RAM program memory, 4 MB integrated data memory
- C-code in a PLC Software architecture and runtime environment
- C-Code application is a part of IEC 61131-3 application
- ANSI C89, C99 with a restricted set of standard library functions
- GNU GCC 4.7.0 compiler toolchain, external library linkage not allowed
- Certified proprietary hardware/software

3 The MPC Problem and QP Solver

- The Problem Formulation
- A Primal-Dual First-Order QP Solver

Performance of The Embedded MPC on AC500 PM592-ETH PLC

5 Conclusion

The MPC Problem (Corresponding to design in SEPTIC)

subject to

$$\begin{split} \underline{y} &- \varepsilon_{l} \leqslant y(k) \leqslant \overline{y} + \varepsilon_{h}, & k \in [k_{0} + H_{w}, \dots, k_{0} + H_{p}], \\ \varepsilon_{h} \geqslant 0, \ \varepsilon_{l} \geqslant 0, \\ y(k) &= y(k|k_{0}), \ \text{e.g. step resp. model} & k \in [k_{0} + H_{w}, \dots, k_{0} + H_{p}], \\ \underline{u} \leqslant u(k) \leqslant \overline{u}, & k \in [k_{0}, \dots, k_{0} + H_{u}], \\ \underline{\Delta u} \leqslant \Delta u(k) \leqslant \overline{\Delta u}, & k \in [k_{0}, \dots, k_{0} + H_{u}], \\ u(k) &= u(k-1) + \Delta u(k), & k \in [k_{0}, \dots, k_{0} + H_{u}], \end{split}$$

The QP Problem (Formulated in MPC code generator)

min
$$Y(k)^{T}Q_{y}Y(k) + U(k)^{T}Q_{u}U(k) + \Delta U(k)^{T}P\Delta U(k)$$

- $\mathcal{V}(k)^{T}Q_{u}U(k) - \mathcal{T}(k)^{T}Q_{y}Y(k) + \rho_{h}^{T}\varepsilon_{h} + \rho_{l}^{T}\varepsilon_{l}$ (2)

subject to

$$\begin{split} &\Omega Y(k)\leqslant \omega + M_h\varepsilon_h + M_l\varepsilon_l, \ \varepsilon_h \geqslant 0, \ \varepsilon_l \geqslant 0, \\ &Y(k) = \Psi \Delta \bar{U}(k-1) + \Upsilon u(k-N) + \Theta \Delta U(k) + 1\nu(k), \\ &E\Delta U(k)\leqslant e, \\ &FU(k)\leqslant f, \\ &\kappa U(k) = \tau u(k-1) + \Delta U(k), \end{split}$$

According to the notations of *Maciejowski*, (2002)

D. K. M. Kufoalor (Giorgio)

< □ > < □ > < □ > < □ > < □ > < □ >

Standard QP

The variables of (2) can be grouped together to form the decision vector

$$\mathbf{x}(\mathbf{k}) = \begin{bmatrix} \Delta \mathbf{U}(\mathbf{k})^{\mathsf{T}} & \mathbf{U}(\mathbf{k})^{\mathsf{T}} & \mathbf{Y}(\mathbf{k})^{\mathsf{T}} & \mathbf{\varepsilon}_{\mathbf{h}}^{\mathsf{T}} & \mathbf{\varepsilon}_{\mathbf{l}}^{\mathsf{T}} \end{bmatrix}^{\mathsf{I}}$$

leading to the problem

$$\min\left\{\frac{1}{2}\mathbf{x}(k)^{\mathsf{T}}\mathbf{H}\mathbf{x}(k) + g(k)^{\mathsf{T}}\mathbf{x}(k) \mid \bar{\mathbf{A}}_{i}\mathbf{x}(k) \leqslant \bar{\mathbf{b}}_{i}, \ \mathbf{A}_{e}\mathbf{x}(k) = \mathbf{b}_{e}\right\},\tag{3}$$

where

$$\begin{split} \mathsf{H} &= 2 \cdot \mathsf{blkdiag}(\mathsf{P}, \ \mathsf{Q}_u, \ \mathsf{Q}_y, \ \mathsf{0}, \ \mathsf{0}), \\ \mathsf{g}(\mathsf{k}) &= \begin{bmatrix} \mathsf{0} & -\mathcal{V}(\mathsf{k})^\mathsf{T} \mathsf{Q}_u & -\mathcal{T}(\mathsf{k})^\mathsf{T} \mathsf{Q}_y & \rho_\mathsf{h}^\mathsf{T} & \rho_\mathsf{l}^\mathsf{T} \end{bmatrix}^\mathsf{T}, \\ \bar{\mathsf{A}}_\mathsf{i} &= \begin{bmatrix} \mathsf{E} & \mathsf{0} & \mathsf{0} & \mathsf{0} & \mathsf{0} \\ \mathsf{0} & \mathsf{F} & \mathsf{0} & \mathsf{0} & \mathsf{0} \\ \mathsf{0} & \mathsf{0} & \mathsf{0} & -\mathsf{I} & \mathsf{0} \\ \mathsf{0} & \mathsf{0} & \mathsf{0} & \mathsf{0} & -\mathsf{I} \end{bmatrix}, \quad \bar{\mathsf{b}}_\mathsf{i} = \begin{bmatrix} \mathsf{e} \\ \mathsf{f} \\ \mathsf{\omega} \\ \mathsf{0} \\ \mathsf{0} \end{bmatrix}, \\ \bar{\mathsf{A}}_\mathsf{e} &= \begin{bmatrix} -\mathrm{I} & \mathsf{\kappa} & \mathsf{0} & \mathsf{0} & \mathsf{0} \\ -\Theta & \mathsf{0} & \mathrm{I} & \mathsf{0} & \mathsf{0} \end{bmatrix}, \\ \mathsf{b}_\mathsf{e} &= \begin{bmatrix} \mathsf{\tau} \mathsf{u}(\mathsf{k}-\mathsf{1}) \\ \Psi \Delta \bar{\mathsf{U}}(\mathsf{k}-\mathsf{1}) + \mathsf{\Upsilon} \mathsf{u}(\mathsf{k}-\mathsf{N}) + \mathsf{1} \mathsf{v}(\mathsf{k}) \end{bmatrix}. \end{split}$$

3

イロト イポト イヨト イヨト

$$\min\left\{\frac{1}{2}\mathbf{x}^{\mathsf{T}}\mathbf{H}\mathbf{x} + \mathbf{g}^{\mathsf{T}}\mathbf{x} \mid \mathbf{x} \in \mathbb{X}, \ A_{i} \mathbf{x} \leq b_{i}, \ A_{e} \mathbf{x} = b_{e}\right\},\tag{4}$$

 $x \in \mathbb{R}^n$, $b_e \in \mathbb{R}^{m_e}$ (updated online), and $H \in \mathbb{R}^{n \times n}$ is positive semi-definite. X: bounds on $\Delta U(k)$, U(k), ε_h , ε_l , for which the *projection operator*

$$\pi_{\mathbb{X}}(\hat{\mathbf{x}}) = \arg\min_{\mathbf{x}\in\mathbb{X}} \frac{1}{2} \|\mathbf{x} - \hat{\mathbf{x}}\|^2$$

is cheap to compute. Note: Not for Y(k) constraints (>30k regions in explicit solution).

$$\min\left\{\frac{1}{2}\mathbf{x}^{\mathsf{T}}\mathbf{H}\mathbf{x} + \mathbf{g}^{\mathsf{T}}\mathbf{x} \mid \mathbf{x} \in \mathbb{X}, \ \mathbf{A}_{i}\,\mathbf{x} \leqslant \mathbf{b}_{i}, \ \mathbf{A}_{e}\,\mathbf{x} = \mathbf{b}_{e}\right\},\tag{4}$$

 $x \in \mathbb{R}^n$, $b_e \in \mathbb{R}^{m_e}$ (updated online), and $H \in \mathbb{R}^{n \times n}$ is positive semi-definite. X: bounds on $\Delta U(k)$, U(k), ε_h , ε_l , for which the *projection operator*

$$\pi_{\mathbb{X}}(\hat{\mathbf{x}}) = \arg\min_{\mathbf{x}\in\mathbb{X}} \frac{1}{2} \|\mathbf{x} - \hat{\mathbf{x}}\|^2$$

is cheap to compute. Note: Not for Y(k) constraints (>30k regions in explicit solution). Transform (4) into

$$\min_{\mathbf{x}} \max_{\mathbf{\lambda}} \mathbf{x}^{\mathsf{T}} \mathbf{A}^{\mathsf{T}} \mathbf{\lambda} + \gamma(\mathbf{x}) - \mathbf{\theta}^{*}(\mathbf{\lambda})$$

 γ and θ^* are convex and closed functions, and their *preconditioned proximity operators*, e.g.

$$\operatorname{prox}_{\gamma}(\hat{\mathbf{x}}) = \arg\min_{\mathbf{x}} \gamma(\mathbf{x}) + \frac{1}{2} \|\mathbf{x} - \hat{\mathbf{x}}\|_{\mathsf{T}^{-1}}^2$$
 ,

 $T \succ 0 \in \mathbb{R}^{n \times n}$, can be evaluated in closed-form or computed efficiently.

イロト 不得下 イヨト イヨト

$$\min\left\{\frac{1}{2}x^{\mathsf{T}}\mathsf{H}x + g^{\mathsf{T}}x \mid x \in \mathbb{X}, \ \mathsf{A}_{\mathsf{i}} x \leqslant \mathsf{b}_{\mathsf{i}}, \ \mathsf{A}_{\mathsf{e}} x = \mathsf{b}_{\mathsf{e}}\right\},\tag{4}$$

 $x \in \mathbb{R}^n$, $b_e \in \mathbb{R}^{m_e}$ (updated online), and $H \in \mathbb{R}^{n \times n}$ is positive semi-definite. X: bounds on $\Delta U(k)$, U(k), ε_h , ε_l , for which the *projection operator*

$$\pi_{\mathbb{X}}(\hat{\mathbf{x}}) = \arg\min_{\mathbf{x}\in\mathbb{X}} \frac{1}{2} \|\mathbf{x} - \hat{\mathbf{x}}\|^2$$

is cheap to compute. Note: Not for Y(k) constraints (>30k regions in explicit solution). Transform (4) into

$$\min_{\mathbf{x}} \max_{\boldsymbol{\lambda}} \mathbf{x}^{\mathsf{T}} \mathbf{A}^{\mathsf{T}} \boldsymbol{\lambda} + \gamma(\mathbf{x}) - \boldsymbol{\theta}^{*}(\boldsymbol{\lambda})$$

 γ and θ^* are convex and closed functions, and their *preconditioned proximity operators*, e.g.

$$\mathsf{prox}_\gamma(\hat{x}) = \arg\min_x \gamma(x) + \frac{1}{2} \, \|x - \hat{x}\|_{\mathsf{T}^{-1}}^2$$
 ,

 $T \succ 0 \in \mathbb{R}^{n \times n}$, can be evaluated in closed-form or computed efficiently.

$$A = \begin{bmatrix} A_e \\ A_i \end{bmatrix}, \ b = \begin{bmatrix} b_e \\ b_i \end{bmatrix}, \ \theta^*(\lambda) = \lambda^T b + \iota_{\Lambda}(\lambda), \ \gamma(x) = \frac{1}{2} x^T H x + g^T x + \iota_{\mathbb{X}}(x)$$

 $\iota(\cdot)$ is the indicator function of the corresponding set, e.g.

$$\iota_{\Lambda}(\lambda) = \begin{cases} 0 & \text{if } \lambda \in \left\{ (\lambda_{e}, \lambda_{i}) \in \mathbb{R}^{m_{e}} \times \mathbb{R}^{m_{i}} \, \big| \, \lambda_{i} \ge 0 \right\}, \\ +\infty & \text{otherwise.} \end{cases}$$

D. K. M. Kufoalor (Giorgio)

 (5)

- ensures that the convergence criterion

$$\|\Sigma^{\frac{1}{2}} A \mathsf{T}^{\frac{1}{2}}\|^2 < 1 \tag{6}$$

is satisfied.

3

Remark:

Line 3 in Algorithm 1 is a crucial step:

Good performance can be expected only if the minimization problem in \boldsymbol{x} can be solved efficiently.

Note:

Set \mathbb{X} contains upper/lower bounds on some components of x only, whereas the Hessian H is diagonal.

Since the preconditioner matrix T is diagonal positive definite, the minimizer in line 3 is

$$\boldsymbol{x}_{i+1} = \pi_{\mathbb{X}} \left(- \big(\boldsymbol{H} + \boldsymbol{T}^{-1}\big)^{-1} \big(\boldsymbol{g} - \boldsymbol{T}^{-1}(\boldsymbol{x}_i - \boldsymbol{T}\boldsymbol{A}^{\mathsf{T}}\boldsymbol{\lambda}_{i+1}) \big) \right),$$

where the projection on set $\ensuremath{\mathbb{X}}$ is a component-wise saturation.

2: IP-cold,sp	63.8/65.4	18/18	0.04/0.008/2.35/0.31	0.92/2.14
3: Alg.1-cold	114.6/116.4	785/785	0.04/0.008/2.56/0.31	0.56/1.35
4: Alg.1-cold, <i>sp</i>	102.9/104.7	785/785	0.04/0.008/2.20/0.33	0.54/1.33
5: Alg.1-warm	18.2/19.8	100/100	0.02/0.003/2.81/0.28	0.56/1.35
6: Alg.1-warm, <i>sp</i>	15.3/16.9	100/100	0.02/0.003/2.96/0.31	0.54/1.33

The warm-start variant of Alg.1 outperforms the interior-point method obtained from CVXGEN by a factor of 4 while occupying 40% less memory.

э

Conclusion

Our work provides a viable approach to achieve a functional MPC on a PLC.

Essential aspects include:

- \checkmark automatic code generation,
- ✓ MPC problem size reduction methods,
- ✓ MPC structure preserving transformations,
- \checkmark a primal-dual first-order method, and
- ✓ embedded real-time considerations for the PLC

The results further motivate the use of first-order methods in embedded MPC.
