What is Python?

How to run Python?

Let's get coding

Table of Contents

What is Python?

How to run Python?

Let's get coding

Python's origin

- ▶ Guido Van Rossum (Netherlands)
- ▶ Created in 1991
- ▶ Named after Monty Python's flying circus

Python is a programming language

simple, powerful, fun

Python is a programming language

simple, powerful, fun

Python is mature yet in active development

Python Enhancement Proposals (PEP)

Python is a programming language

simple, powerful, fun

Python is mature yet in active development

Python Enhancement Proposals (PEP)

Python is a scripting language

- ▶ Dynamic typing
- ▶ Object oriented
- ▶ Interactive

Python is a programming language

simple, powerful, fun

Python is mature yet in active development

Python Enhancement Proposals (PEP)

Python is a scripting language

- ▶ Dynamic typing
- ▶ Object oriented
- ▶ Interactive

Python is cross-platform

Linux, Windows, Mac, android phones, ...

Python is glue

Easily interacts with

- ▶ filesystem, operating system
- ▶ command line tools
- ▶ compiled libraries (C, C++, Fortran)

Python is glue

Easily interacts with

- ▶ filesystem, operating system
- ▶ command line tools
- ▶ compiled libraries (C, C++, Fortran)

Python is a universe

- ▶ Batteries included
- ▶ Thousands of high-standard packages out there
- ▶ Open-source effort

Python is versatile

- ▶ Web Programming
- ▶ GUI Development
- ▶ Scientific and Numeric
- ▶ Software Development
- ▶ System Administration

Python happens to be suitable for science

- ▶ The “Scientific and Numeric” has been booming for 5 years
- ▶ Toolstack bundled as 'scipy'
 - ▶ Theano, numexpr, numba (Python math compilers)
 - ▶ **Numpy** (linear algebra)
 - ▶ SymPy (computer algebra system)
 - ▶ Pandas (data analysis)
 - ▶ Fenics, Fipy (Python for PDEs)
 - ▶ Vistrails (Python scientific workflow, data exploration and visualization)
 - ▶ **matplotlib**, chaco (2D plotting)
 - ▶ Mayavi (3D visualization)
 - ▶ Pyomo, cvxpy (Python optimization)

Python is a free and open-source ecosystem

- ▶ Tutorials, documentation
- ▶ Rapid bug-fixing
- ▶ Nightly testing (Continuous integration)
- ▶ Survival of the fittest

Python is popular

- ▶ Lingua Franca
- ▶ A huge user-base to ask/answer questions
- ▶ For every nail you want to hit, there might be 5 hammers out there

IEEE Spectrum's 2014 Ranking

Language Rank	Types	Spectrum Ranking
1. Java	  	100.0
2. C	  	99.3
3. C++	  	95.5
4. Python	 	93.4
5. C#	  	92.4
6. R		74.2
7. MATLAB		72.9
8. PERL	 	70.3
9. SQL		70.3
10. Visual Basic		64.6
11. Objective-C	 	64.5
12. Shell		62.3
13. Go	 	60.0
14. Processing	 	51.9
15. D	 	50.2
16. Lua	 	47.8
17. Fortran		46.7
18. LISP		44.3
19. Haskell	 	44.1
20. Delphi	 	43.2
21. Prolog		38.2
22. Clojure	 	37.2

Table of Contents

What is Python?

How to run Python?

Let's get coding

Option A: as command line argument

```
$ python -c "print 'hello world'"
```

Option B: editor + command line invocation

Notepad++ (Windows)

Option B: editor + command line invocation

Scite (Windows, Linux, Mac)

Option B: editor + command line invocation

Gedit (Linux)

Option B: editor + command line invocation

Emacs (Windows, Linux, Mac)

```
jg@moinette (10.33.132.20) - byobu
jg@moinette (10.33.132.20) - byobu x jg@jg-VirtualBox: ~
File Edit Options Buffers Tools Python Help
print "hellow world"

-UUU:**--F1 hello.py All L1 (Python)-----
```

Vim (Windows, Linux, Mac)

Option B: editor + command line invocation

```
$ python hello.py
```

What you get

- ▶ Syntax highlighting

Option C: interactive

IPython (Windows, Linux, Mac)

```
jg@jg-VirtualBox: ~  
jg@jg-VirtualBox:~$ ipython  
Python 2.7.4 (default, Apr 19 2013, 18:28:01)  
Type "copyright", "credits" or "license" for more information.  
  
IPython 0.13.2 -- An enhanced Interactive Python.  
?          -> Introduction and overview of IPython's features.  
%quickref  -> Quick reference.  
help       -> Python's own help system.  
object?    -> Details about 'object', use 'object??' for extra details.  
  
In [1]: print "hello world"  
hello world  
  
In [2]:
```

Option C: interactive

IPython (Windows, Linux, Mac)

The screenshot shows a terminal window titled "jg@jg-VirtualBox: ~". The terminal displays the command "ipython" being executed, which outputs the Python version (2.7.4) and the IPython version (0.13.2). It then shows a list of commands and their descriptions: "?", "%quickref", "help", and "object?". Finally, it shows the execution of "run hello.py" which outputs "hello world".

```
jg@jg-VirtualBox: ~  
jg@jg-VirtualBox:~$ ipython  
Python 2.7.4 (default, Apr 19 2013, 18:28:01)  
Type "copyright", "credits" or "license" for more information.  
  
IPython 0.13.2 -- An enhanced Interactive Python.  
?          -> Introduction and overview of IPython's features.  
%quickref  -> Quick reference.  
help       -> Python's own help system.  
object?    -> Details about 'object', use 'object??' for extra details.  
  
In [1]: run hello.py  
hello world  
  
In [2]:
```

Option C: interactive IPython (Web)

The screenshot shows a Mozilla Firefox browser window with the title "Try IPython from your Browser: PythonAnywhere - Mozilla Firefox". The address bar shows the URL "https://www.pythonanywhere.com/try-ipython/". The page features the PythonAnywhere logo and navigation links: "Send feedback", "Forums", "Help", "Blog", "Pricing & signup", and "Log in". The main heading is "Try IPython from your browser!".

IPython is an enhanced interactive Python interpreter, offering tab completion, object introspection, and much more. It's running on the right-hand side of this page, so you can try it out right now.

Here's a quick micro-tutorial to get you started with some of the fun stuff it provides:

- Type `imp` then tab to get `import` then type `nu` and tab to see which modules you can import that start with `'nu'`.

The IPython interface on the right shows the following text:

```
Type "copyright", "credits" or "license"

IPython 2.1.0 -- An enhanced Interactive
?          -> Introduction and overview of
%quickref  -> Quick reference.
help       -> Python's own help system.
object?    -> Details about 'object', use

In [1]: print "hello world"
hello world

In [2]:
```

At the bottom, the copyright notice reads: "Copyright © 2014 PythonAnywhere LLP — Terms — Privacy" and "Python" is a registered trademark of the Python Software Foundation.

Option C: interactive

What you get

- ▶ Tab completion
- ▶ Command history

To paste in IPython, type `%paste`

Option D: integrated development environment (IDE)

Eclipse (Windows, Linux, Mac)

Option D: integrated development environment (IDE)

Spyder (Windows, Linux, Mac)

Option D: integrated development environment (IDE)

What you get

- ▶ Syntax highlighting
- ▶ Tab completion
- ▶ Command history
- ▶ Debugging tools
- ▶ Static code analysis

Table of Contents

What is Python?

How to run Python?

Let's get coding

Syntax: assignment

```
variable = object
```

Properties

- ▶ Every piece of data is an object
- ▶ A variable is a reference to an object
- ▶ The object stays alive as long as some variable points to it (reference counted)

Datatypes: integer

```
a = 3
```

Properties

- ▶ Immutable

Datatypes: integer

```
a = 3
```

Properties

- ▶ Immutable

```
a = a + 1  
a += 1
```

Datatypes: integer

```
a = 3
```

Properties

► Immutable

```
a = a + 1  
a += 1
```

```
a = 1/2 # a = 0
```

Datatypes: bool

```
a = True  
a = False
```

Properties

- ▶ Immutable

Datatypes: float

```
a = 2.0
```

```
a = 2e-3
```

Datatypes: float

```
a = 2.0  
a = 2e-3
```

Properties

- ▶ Immutable

```
print a <= 0, a+1
```

```
False, 1.002
```

Datatypes: str

```
a = "spam"  
a = 'spam'  
a = "hello\nworld"
```

Properties

- ▶ Immutable

Datatypes: str

```
a = "spam"  
a = 'spam'  
a = "hello\nworld"
```

Properties

► Immutable

```
print a  
print "world" in a, "spam" + "eggs", "spam" * 3
```

```
hello  
world  
True, spameggs, spamspamspam
```

Datatypes: str

```
a = "spam"  
a = 'spam'  
a = "hello\nworld"
```

```
hello  
world  
True, spameggs, spamspamspam
```

Datatypes: set

```
a = {}          # empty set  
a = {"spam", 3}  
a = {3}  
a = {1, 2, 3}
```

Properties

- ▶ Unordered
- ▶ No duplicates
- ▶ Mutable

Datatypes: set

```
a = {}          # empty set
a = {"spam", 3}
a = {3}
a = {1, 2, 3}
```

Properties

- ▶ Unordered
- ▶ No duplicates
- ▶ Mutable

```
print 2 in a, 5 in a
print a.union({2, 5})
```

```
True, False
set([1, 2, 3, 5])
```

Datatypes: list

```
a = ["spam", 3]
a = []      # empty list
a = [1, 2, 3]
```

Properties

- ▶ Ordered
- ▶ Duplicates allowed
- ▶ Mutable

Datatypes: list

```
a = ["spam", 3]
a = [] # empty list
a = [1, 2, 3]
```

Properties

- ▶ Ordered
- ▶ Duplicates allowed
- ▶ Mutable

```
print a[0], 2 in a, a.index(2)
```

```
1, True, 1
```

Datatypes: tuple

```
a = (1, 2, 3)
a = ("spam", 3)
a = (3,) # note trailing comma
a = ()   # empty tuple
```

Properties

- ▶ Ordered
- ▶ Duplicates allowed
- ▶ Immutable

Datatypes: dict

```
a = {"spam": 3, "eggs": 1}
a = {3 : "spam", (1,2): "eggs"}
a = dict()      # empty dictionary
a = dict(spam=3, eggs=1)
```

Properties

- ▶ Unordered
- ▶ No duplicate keys allowed
- ▶ Immutable

Keys must be of immutable type

Datatypes: dict

```
a = dict(spam=3, eggs=1)
```

```
print "spam" in a, "eggs" in a, "foo" in a  
print "spam" in a.keys()  
print 3 in a, 3 in a.values()
```

```
True True False  
True  
False True
```

Syntax: assignment (2)

Recall

- ▶ Every piece of data is an object
- ▶ **A variable is a reference to an object**
- ▶ The object stays alive as long as some variable points to it (reference counting)

```
a = {"spam": 3, "eggs": 1}
a = 6
```

Syntax: assignment (2)

Recall

- ▶ Every piece of data is an object
- ▶ **A variable is a reference to an object**
- ▶ The object stays alive as long as some variable points to it (reference counting)

```
a = [1, 2, 3]
b = a
b[0] = 7
print a
```

```
[7, 2, 3]
```

Objects

Observation

- ▶ Everything is an object ...
- ▶ ... **so everything has methods and attributes**

Using packages

The creative cycle in Python

1. Imagine it (ascii art)
2. Google it (pyfiglet)
3. Install it (`pip install pyfiglet` – Windows, Linux, Mac)
4. Import it

Using packages

```
import pyfiglet

teachers = ["moritz", "joel", "greg", "joris"]

for t in teachers:
    print pyfiglet.figlet_format(t, font="starwars")
```

Using packages

```
import pyfiglet

teachers = ["moritz", "joel", "greg", "joris"]

for t in teachers:
    print pyfiglet.figlet_format(t, font="starwars")
```

moritz

joel

Using packages

```
import pyfiglet as pf

teachers = ["moritz", "joel", "greg", "joris"]

for t in teachers:
    print pf.figlet_format(t, font="starwars")
```

moritz

joel

Using packages

```
from pyfiglet import figlet_format

teachers = ["moritz", "joel", "greg", "joris"]

for t in teachers:
    print figlet_format(t, font="starwars")
```

moritz

joel

Using packages

```
from pyfiglet import figlet_format as asciiart

teachers = ["moritz", "joel", "greg", "joris"]

for t in teachers:
    print asciiart(t, font="starwars")
```

ASCII art output for the first row of names using the 'starwars' font:

```

. _ _ .   _ _   . _ _   _   . _ _ _ . _ _   /
| \ / |   / _ \ | | | | | | | | | | | | | | | | | | | |
| \ / |   | | | | | | | | | | | | | | | | | | |
| \| |   | | | | | | | | | | | | | | | | | | |
| | |   | | | | | | | | | | | | | | | | | | |
|_|_|   \_ _ _/ | _ \ . _ _ | | | | | | | | | |

```

ASCII art output for the second row of names using the 'starwars' font:

```

. _ _ .   _ _   _ _ _   _ _
| \ / |   / _ \ | | | | | | | | | |
| \ / |   | | | | | | | | | |
| \| |   | | | | | | | | | |
|_|_|   \_ _ _/ | _ _ _/ | _ _ _/

```

Using packages

```
from pyfiglet import *  
  
teachers = ["moritz", "joel", "greg", "joris"]  
  
for t in teachers:  
    print figlet_format(t, font="starwars")
```

moritz

joel

Slicing

```

results = (teachers, namelengths)
pickle.dump(results, file('results.pkl', 'w'))
```

Pickling

```
import pickle

teachers = ["moritz", "joel", "greg", "joris"]
namelengths = [len(p) for p in teachers]

results = (teachers, namelengths)
pickle.dump(results, file('results.pkl', 'w'))
```

```
import pickle

teachers, namelengths =
    pickle.load(file('results.pkl', 'r'))
print teachers, namelengths
```

```
['moritz', 'joel', 'greg', 'joris'] [6, 4, 4, 5]
```

Command line arguments

Code Listing 4: simulator.py

```
import numpy as np
import sys

N = int(sys.argv[1])
items = sys.argv[2:]

for i in range(N) :
    n = len(items)
    print items[np.random.randint(n)]
```

Command line arguments

Code Listing 5: simulator.py

```
import numpy as np
import sys

N = int(sys.argv[1])
items = sys.argv[2:]

for i in range(N):
    n = len(items)
    print items[np.random.randint(n)]
```

```
$ python simulator.py 3 spam eggs
```

```
eggs
spam
spam
```

Command line arguments

```
$ python simulator.py spam eggs 3
```

```
ValueError

        """ % sys.argv[1])
```

```
Exception: Oops. Expecting a number but
    you supplied me with 'spam'.
```

Command line arguments

Code Listing 7: simulator.py

```
from argparse import *
import numpy as np

p = ArgumentParser(
    description="Simulate drawing from a collection")
p.add_argument('--N', type=int, default=10,
    help="The number of draws")
p.add_argument('items', type=str, nargs='+',
    metavar='item', help='the items to draw from')
p.add_argument('--special', action='store_true')

args = p.parse_args()

for i in range(args.N):
    n = len(args.items)
    print args.items[np.random.randint(n)]
```

Command line arguments

```
$ python simulator.py
```

```
usage: hello.py [-h] [--N N] [--special] item [item ...]  
hello.py: error: too few arguments
```

Command line arguments

```
$ python simulator.py -h
```

```
usage: hello.py [-h] [--N N] [--special] item [item ...]
```

Simulate drawing from a collection

positional arguments:

item the items to draw from

optional arguments:

-h, --help show this help message and exit

--N N The number of draws

--special

Command line arguments

```
$ python simulator.py --N 3 spamm eggs
```

```
spamm  
eggs  
eggs
```

Interacting with the shell

```
import subprocess

items = ["spam", "eggs"]

N = 3
p = subprocess.Popen(
    ["python", "simulator.py", "--N", "%d" % N] + items,
    stdout=subprocess.PIPE, stderr=subprocess.PIPE)

stdout, stderr = p.communicate()
print stdout
```

```
eggs
spam
eggs
```

Interacting with the shell

Conclusion

This should be enough background to explore the Python universe

Happy coding!
